Winds

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Summary

NLTE analysis of hot stars

- hot stars: spectral types A, B, O
- $T_{
 m eff}\gtrsim 8500\,
 m K$

common characteristics

- absence of molecular lines
- less atomic lines
- purely radiative atmosphere (no convection)
- NLTE effects more intensive influence atmospheric structure

Ninds

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Summary

NLTE analysis of hot stars

- hot stars: spectral types A, B, O
- $T_{
 m eff}\gtrsim 8500\,
 m K$

specific features

- A quiet atmospheres, chemical peculiarities stratification of the atmospheres
- B some stars pulsating (e.g. β Cep), also non-radially some stars rapidly rotating, with emission
- O strong stellar winds

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Summary

NLTE analysis of hot stars

Two types of NLTE analysis

full NLTE models

NLTE model atmospheres consistent approach

NLTE for trace elements

model atmosphere (LTE or NLTE) fixed NLTE for selected atoms may be close to consistent

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

NLTE for trace elements

solution in two steps

- 1. calculation of a model atmosphere
 - include opacities important for atmospheric structure (continua of abundant elements, strong lines)
 - many weaker lines may be neglected (no effect on the atmospheric structure)
 - can be LTE or NLTE model

Summary

NLTE for trace elements

solution in two steps

- 1. calculation of a model atmosphere
 - include opacities important for atmospheric structure (continua of abundant elements, strong lines)
 - many weaker lines may be neglected (no effect on the atmospheric structure)
 - can be LTE or NLTE model
- 2. solution of a NLTE problem
 - model atmosphere is fixed
 - solution of a NLTE problem for a selected element (trace element)
 - detailed model atom with many lines and continua

Hot stars

Winds

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Summary

NLTE for trace elements

conditions

- influence of the trace element on the atmospheric structure is negligible
- opacity of the trace element is negligible compared to the opacity of non-trace element
- or NLTE effects on opacities have negligible influence on the atmospheric structure
- not a significant source of free electrons

Hot stars

Winds

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

Summary

NLTE for trace elements

conditions

- influence of the trace element on the atmospheric structure is negligible
- opacity of the trace element is negligible compared to the opacity of non-trace element
- or NLTE effects on opacities have negligible influence on the atmospheric structure
- not a significant source of free electrons
- any detailed calculation *must not* influence the rest if this happens → improve your background model

NLTE for trace elements

LTE model atmosphere

Trace

- elastic collisions maintain equilibrium velocity distribution
- inelastic collisions maintain thermodynamic equilibrium (TE) collisions mostly with electrons
- radiative transitions depart level populations from TE
- LTE: inelastic collisions >> radiative transitions
- NLTE: radiative transitions \gtrsim inelastic collisions
- inconsistent approach, if LTE model atmosphere is used

NLTE model atmosphere preferred

Full NLTE model atmospheres

- may be part of the trace element procedure
- structure different from LTE models

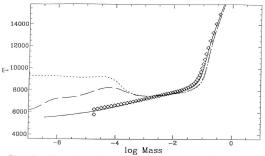

Fig. 5. Comparison of our LTE line blanketed model (full line) and the Kurucz model (diamonds); and two NLTE models: a "classical" NLTE/L hydrogen-carbon model (dotted line), and a NLTE line blanketed model (dashed line).

Hubeny & Lanz, 1993, APSC 44, 98

Solution of a NLTE model atmosphere

equations

- radiative transfer

 (I_{μν})
- statistical equilibrium (n_i)
- hydrostatic
 equilibrium (ρ)
- radiative equilibrium (T)

$$\mu \frac{dI_{\mu\nu}(z)}{dz} = \eta_{\nu}(z) - \chi_{\nu}(z)I_{\mu\nu}(z)$$

$$n_{i} \sum_{l} (R_{il} + C_{il}) + \sum_{l} n_{l} (R_{li} + C_{li}) = 0$$

$$\frac{dp}{dm} = g - \frac{4\pi}{c} \int_{0}^{\infty} \frac{\chi_{\nu}}{\rho} H_{\nu} d\nu$$

$$4\pi \int_{0}^{\infty} (\chi_{\nu}J_{\nu} - \eta_{\nu}) d\nu = 0$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

Solution of a NLTE model atmosphere

equations

- radiative transfer

 (I_{μν})
- statistical equilibrium (n_i)
- hydrostatic equilibrium (ρ)
- radiative equilibrium (T)

$$\mu \frac{dI_{\mu\nu}(z)}{dz} = \eta_{\nu}(z) - \chi_{\nu}(z)I_{\mu\nu}(z)$$

$$n_{i} \sum_{l} (R_{il} + C_{il}) + \sum_{l} n_{l} (R_{li} + C_{li}) = 0$$

$$\frac{dp}{dm} = g - \frac{4\pi}{c} \int_{0}^{\infty} \frac{\chi_{\nu}}{\rho} H_{\nu} d\nu$$

$$4\pi \int_{0}^{\infty} (\chi_{\nu}J_{\nu} - \eta_{\nu}) d\nu = 0$$

solution of a nonlinear set of equations

- using Newton-Raphson method (linearization)
- combinaton with accelerated lambda iteration method

Winds

Summary

Model atmosphere grids

instead of calculating new models (time savings)

LTE model grids

Kurucz

grid of LTE line blanketed model atmospheres, practically for all reasonable temperatures and gravities

NLTE model grids

TLUSTY

grid of line blanketed NLTE models for O stars and B stars

(Lanz & Hubeny 2003, ApJS 147, 225; 2007, ApJS 169,83)

using a grid we are fixed to grid parameters (T_{eff} , g, R_{\star} , M_{\star} , L_{\star} , abundances, ...)

Winds

Summary

LTE/NLTE atmosphere modelling

- LTE model calculated within several seconds
- NLTE model calculated within several hours

do we really gain anything?

- more accurate level populations
- more accurate opacities
- more accurate radiation field
- more accurate temperature structure (in models)

is it worth of effort?

(after Przybilla et al. 2011, J. Phys. Conf. Ser. 328, 012015)

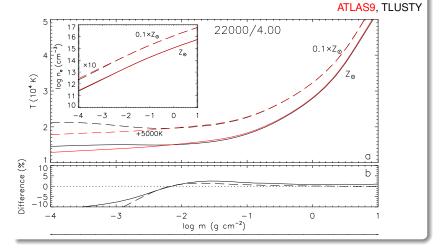

comparison of

- full LTE analysis (ATLAS9 / SYNTHE)
- full NLTE analysis (TLUSTY / SYNSPEC), grids of models
- hybrid LTE / NLTE analysis (ATLAS9 / DETAIL / SURFACE)

line blanketed models 15 000 K $\leq {\it T_{eff}} \leq$ 35 000 K

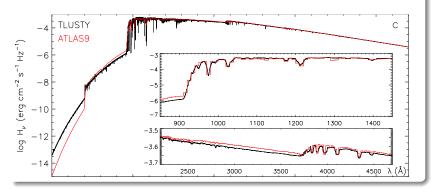

temperature structure

(after Przybilla et al. 2011, J. Phys. Conf. Ser. 328, 012015)

Hot stars with winds

Stellar wind

- outflow of material from the stellar surface
- present for most of massive stars
- mass-loss rate $\frac{dM}{dt}$ up to $10^{-6} M_{\odot}$ year⁻¹
- terminal velocity v_∞ up to \sim 3000 km s^{-1}
- outflow driven by radiation
 - continuum (electron scattering + b-f + f-f)
 - line (resonance lines of metals)
 - H, He \rightarrow negligible radiation force
 - momentum transferred by Coulomb collisions
- for brighter stars stronger winds

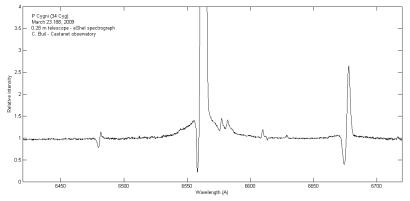

winds have to be taken into account in analysis

Winds

Summary

Hot stars with winds

P Cygni profiles

these profiles are formed in a spherical expanding medium (wind)

Hot stars with winds

- large velocity gradients ⇒ radiation can be described using Sobolev approximation
- NLTE effects present
- solution of ESE + RTE is local

Summary

Hot stars with winds

core-halo approximation

wind does not influence the photosphere photospheric flux – lower boundary condition for a wind analysis done by parts (photosphere, winds) NLTE line blanketing is a must

- photospheric lines are selected (lines expected not to be influenced by wind)
- these lines serve for T_{eff} determination (used as for static models)
- then the wind line profiles are calculated for given v(r) and $\rho(r)$ determination of mass-loss rate
- wind modelling NLTE for trace elements

- for hot stars NLTE analysis necessary
- LTE/NLTE model atmospheres + NLTE for trace elements

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

- model atoms have to be carefully constructed
- NLTE model atmospheres should be preferred (more exact)
- model grids may save computing time
- systematic influence of stellar wind
